

This is the documentation for

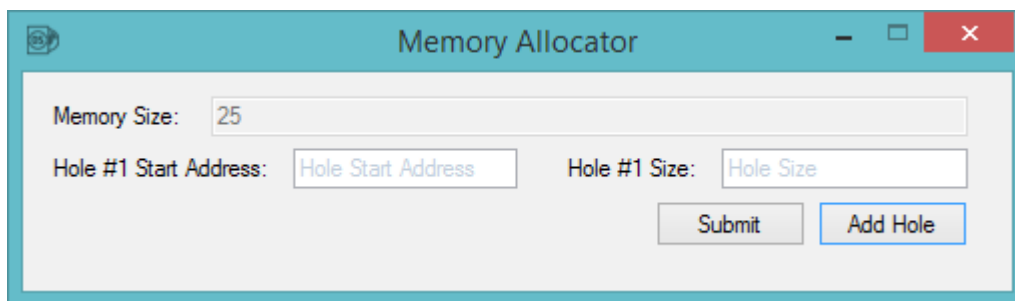

OPERATING SYSTEMS MEMORY ALLOCATOR

How to use it:

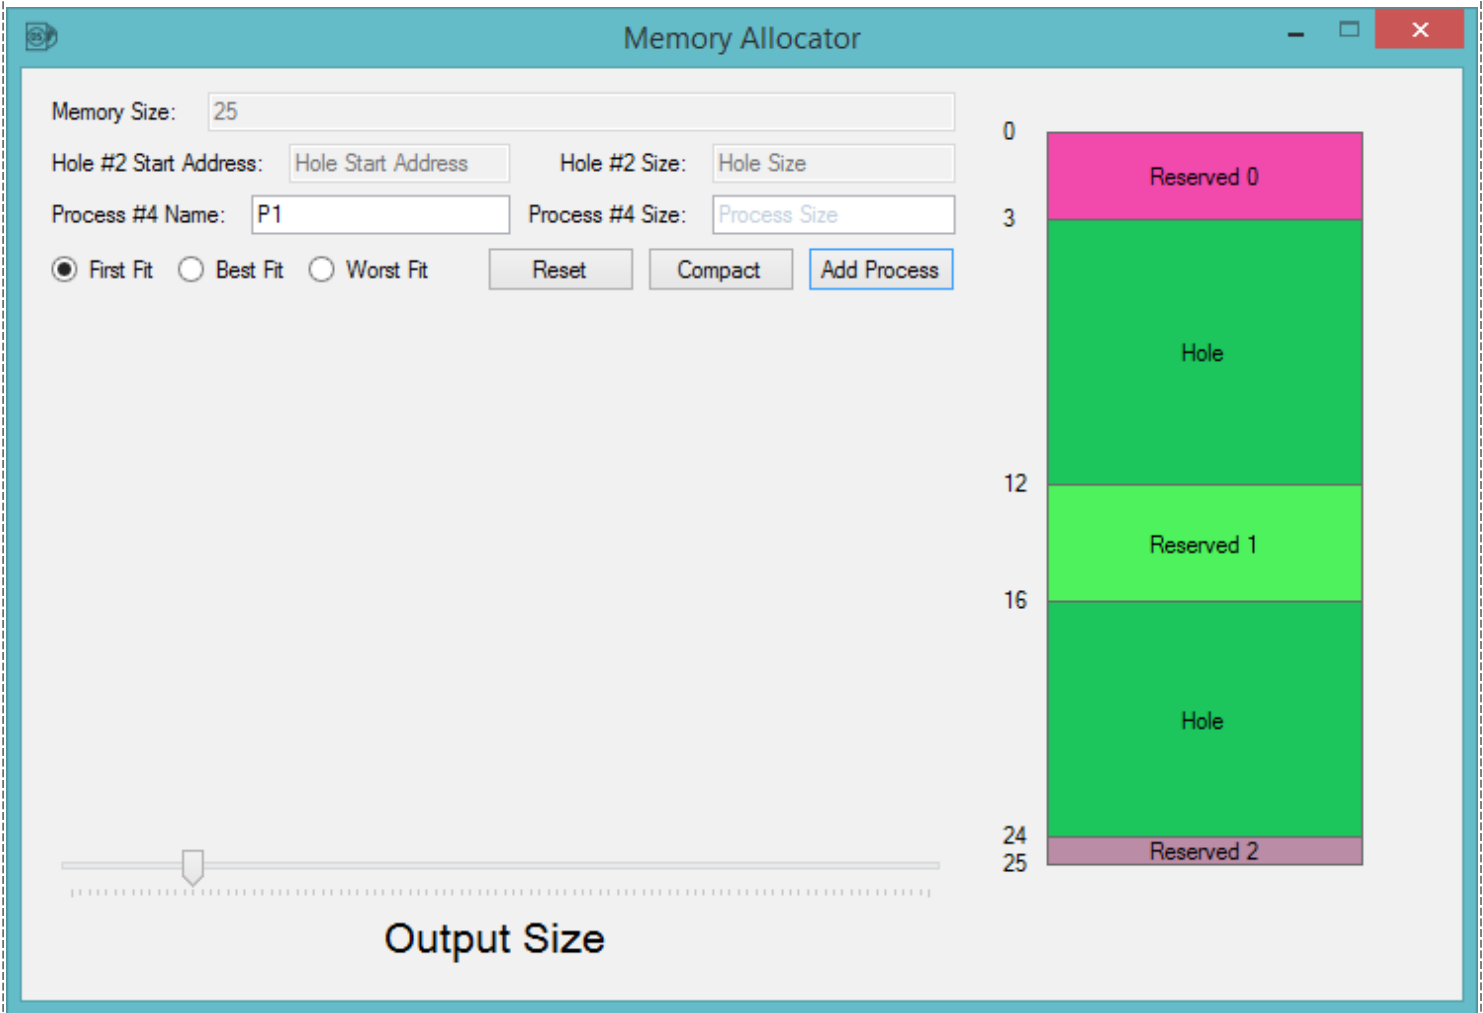

- Open `memory-allocation-gui-app.exe` .

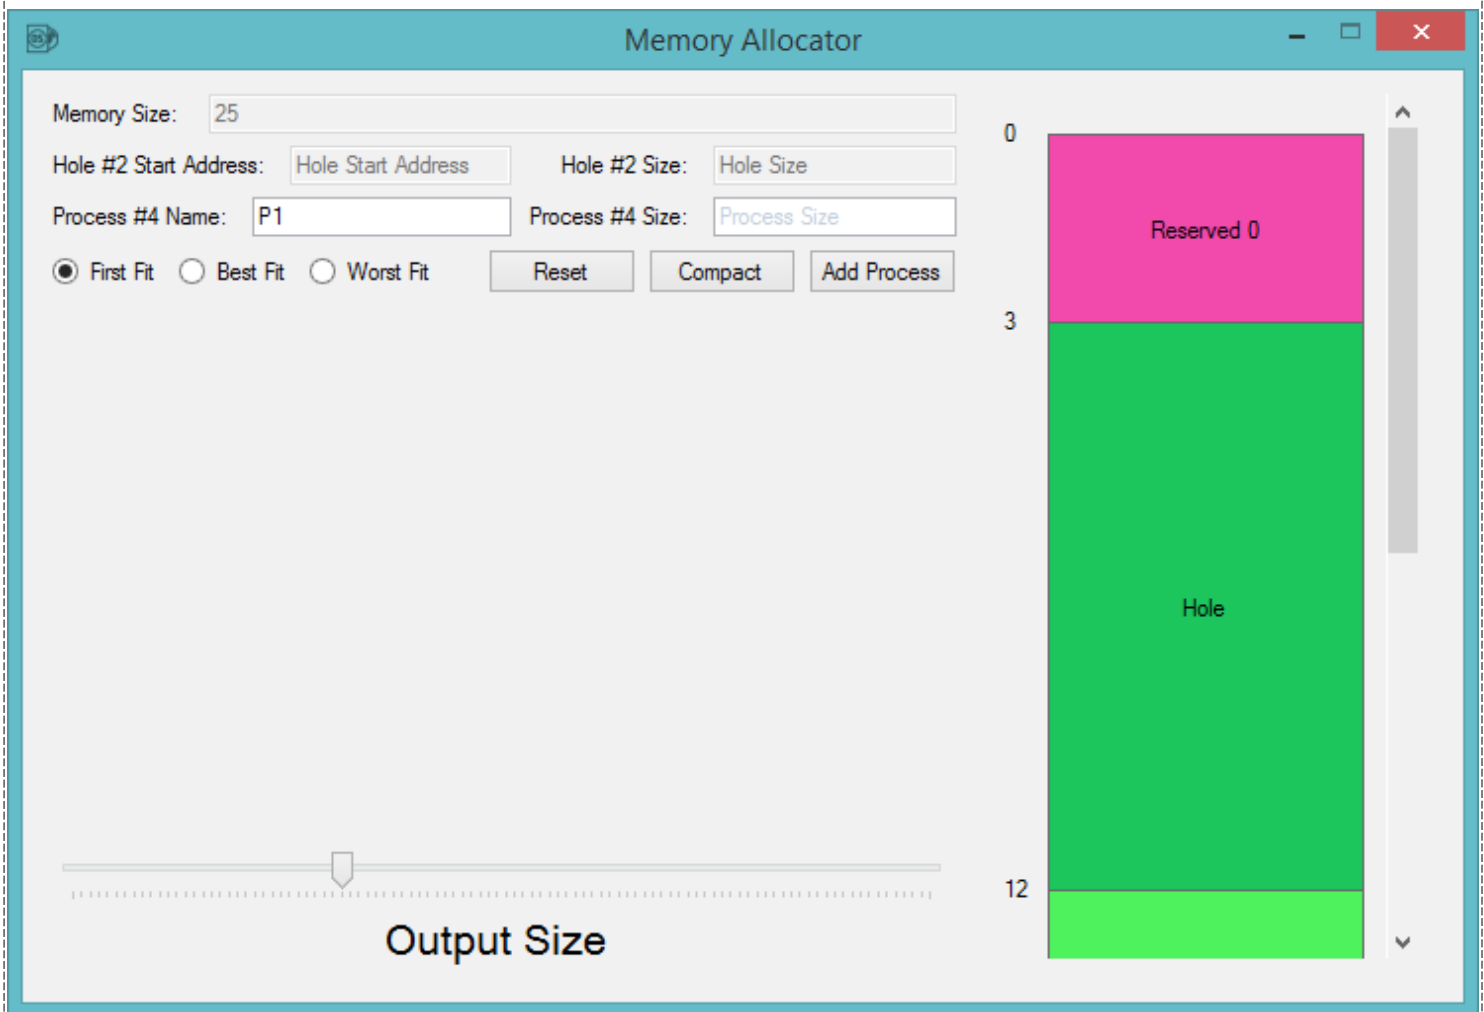

- Choose a memory size and click on  .

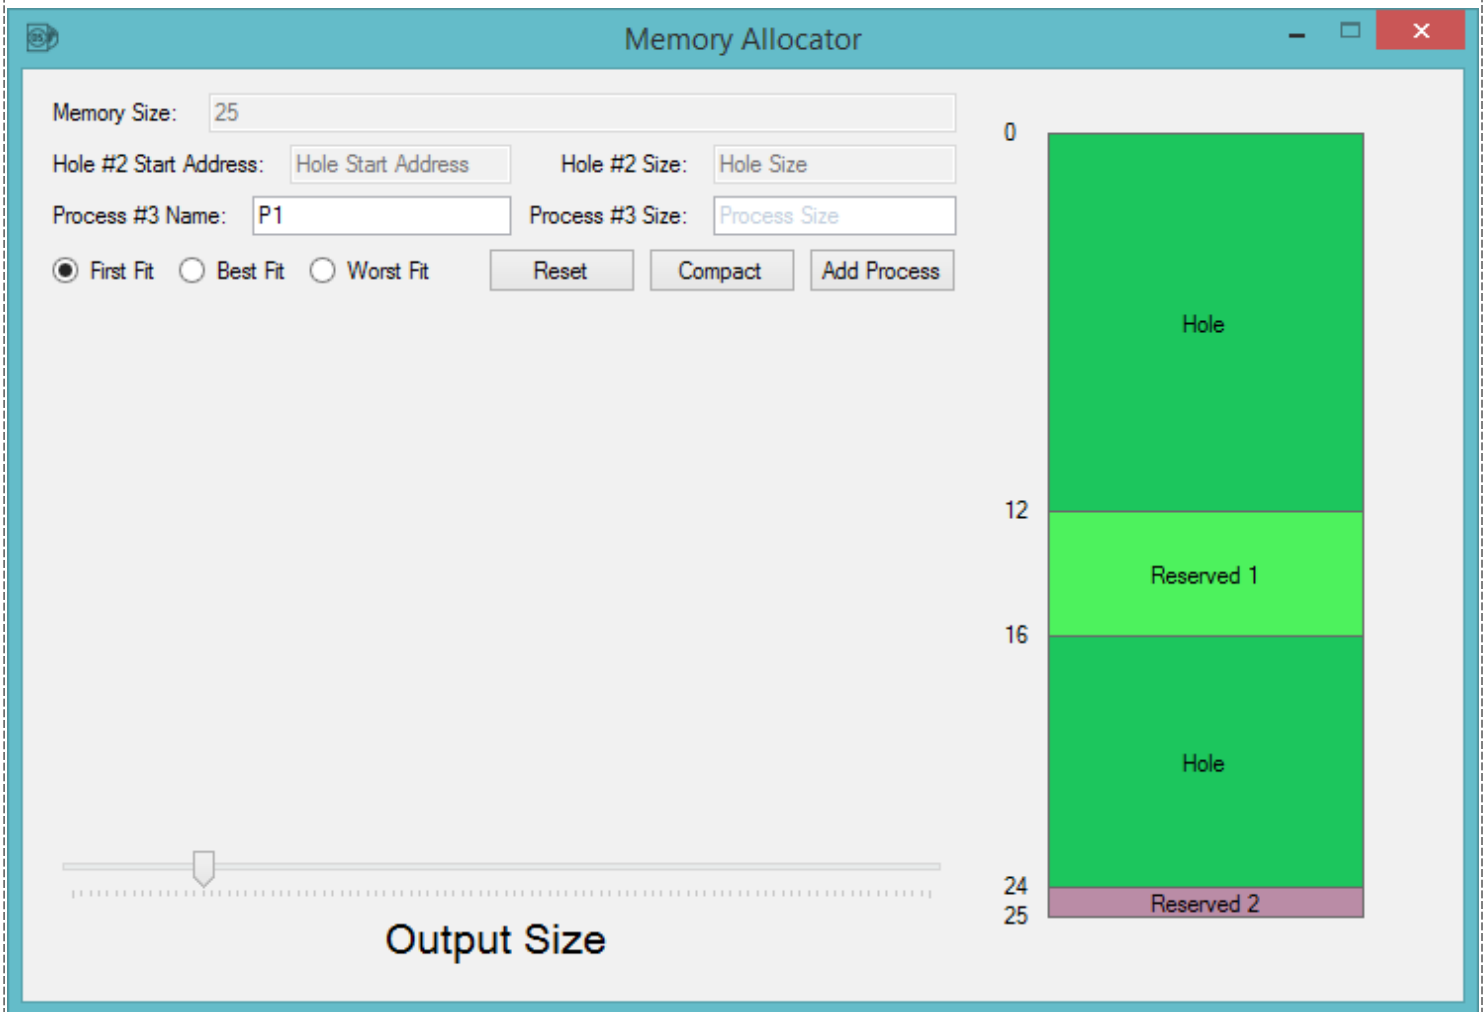

- Add as many holes as you want than click Submit again.

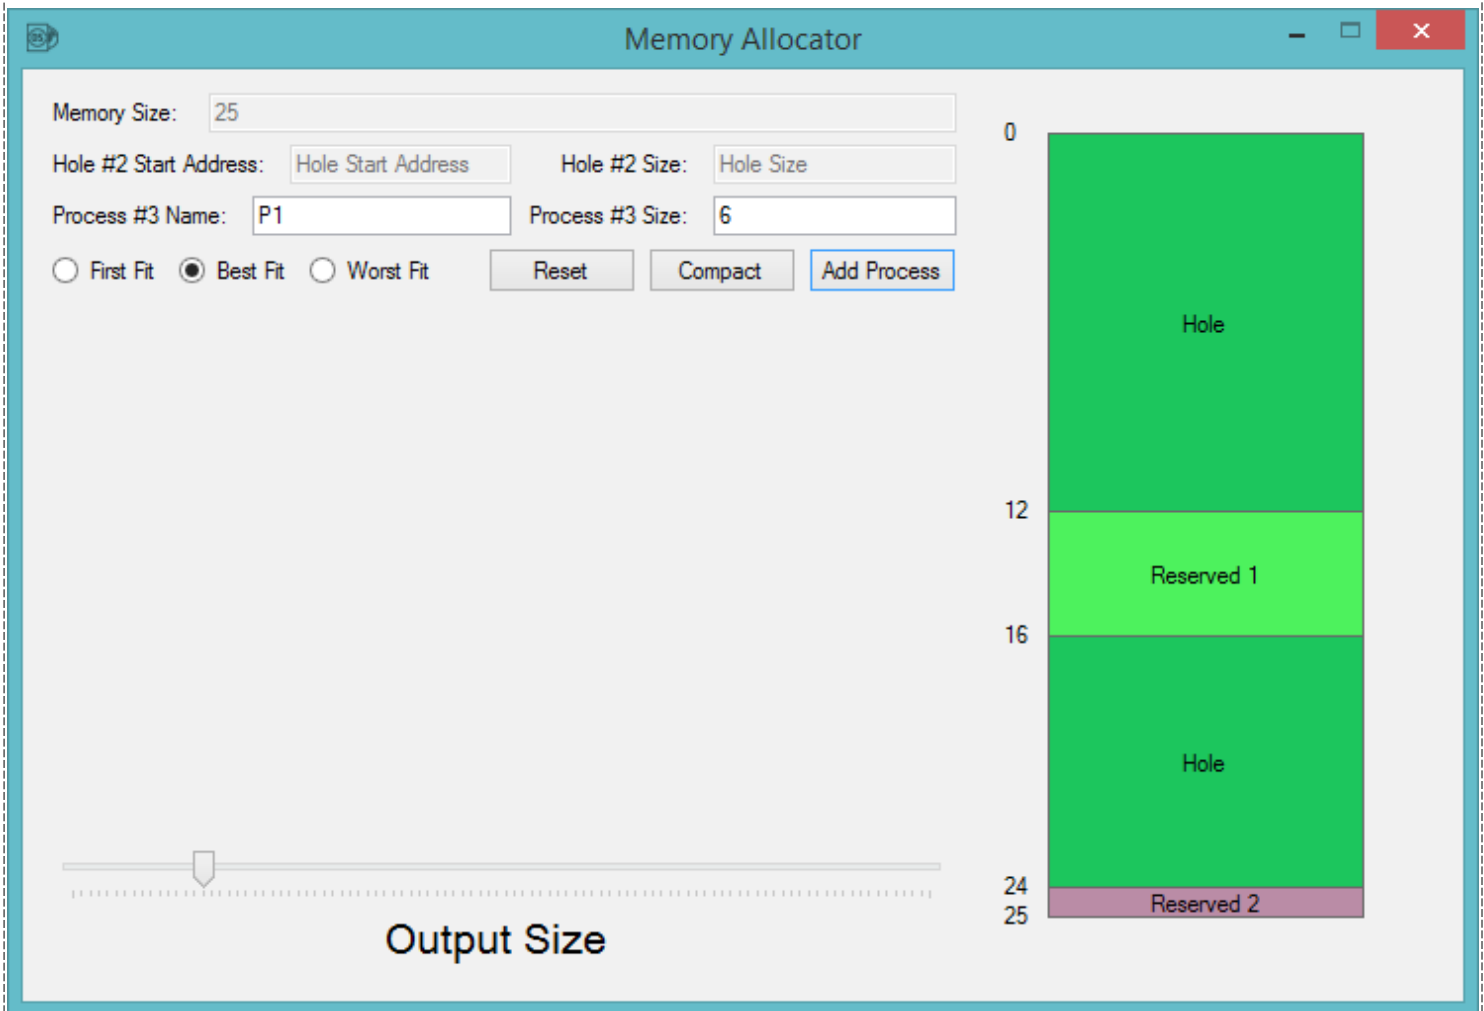

- You can resize the output memory graph using the scroll bar.

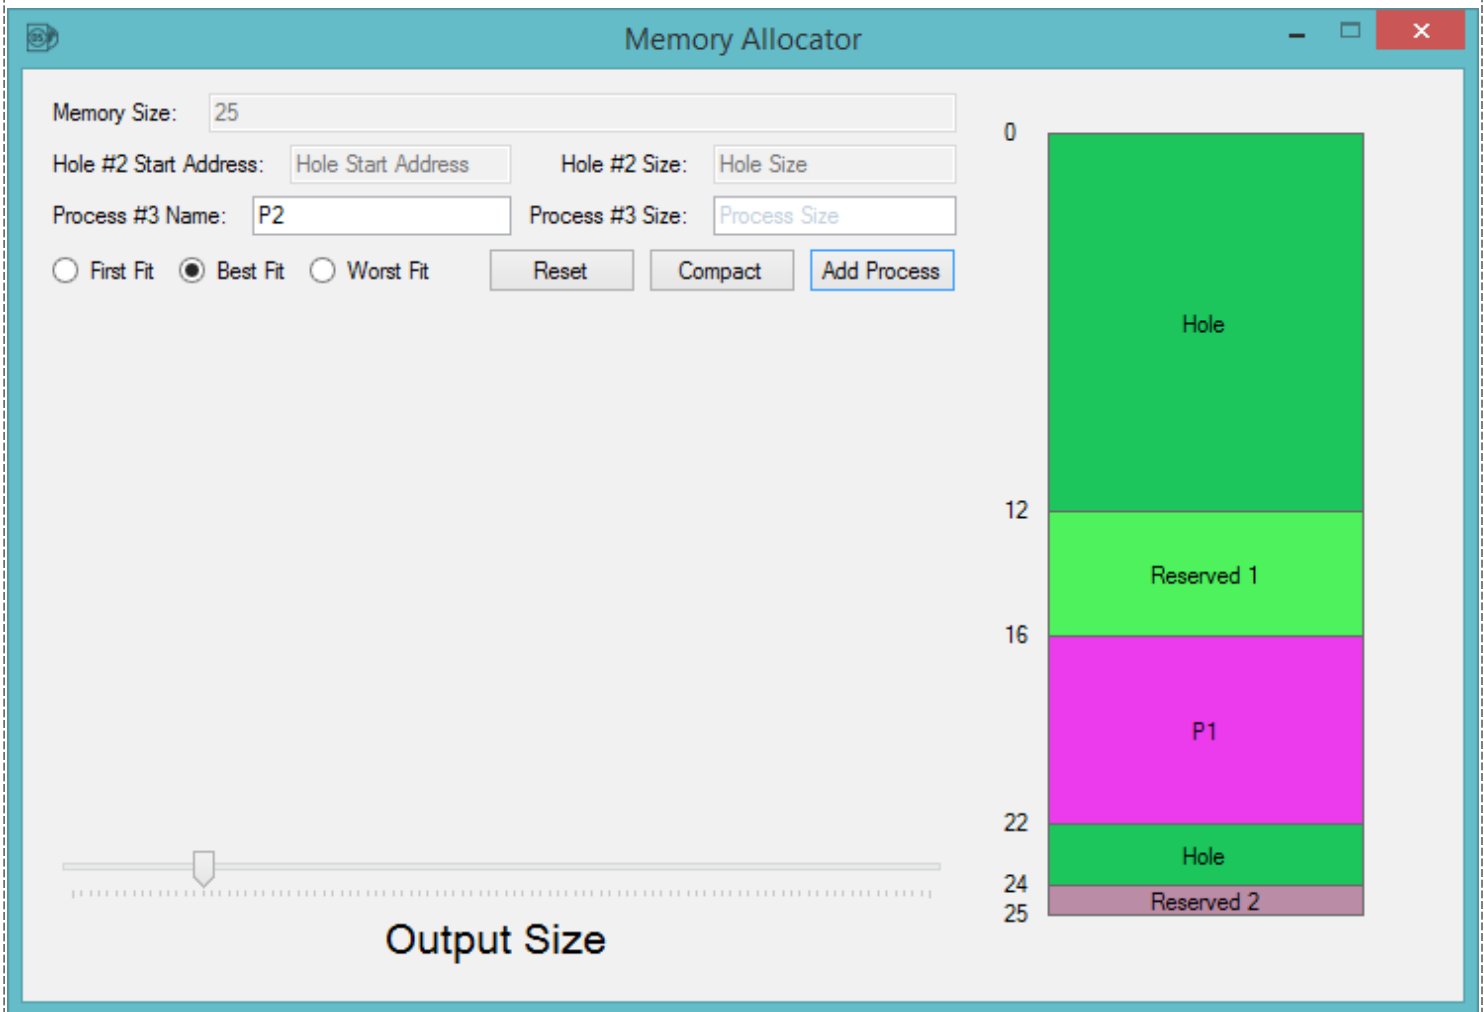

- You can remove a process from the memory by double clicking on it.

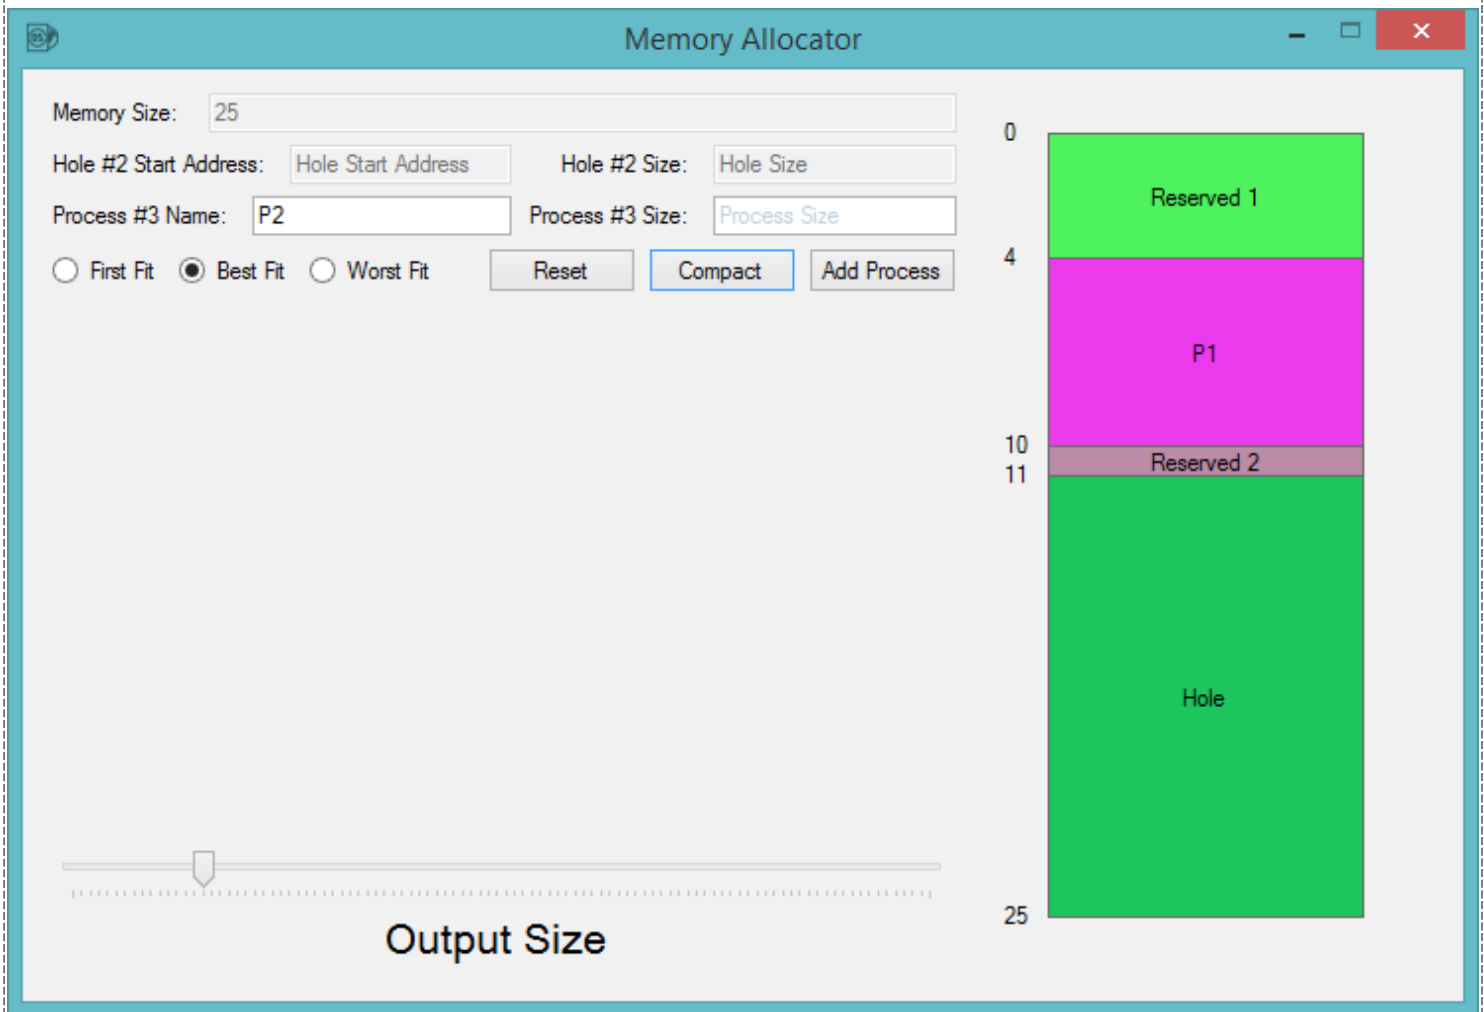

- To input a new process choose a name and a size then choose the allocating algorithm and click on **Add Process** .

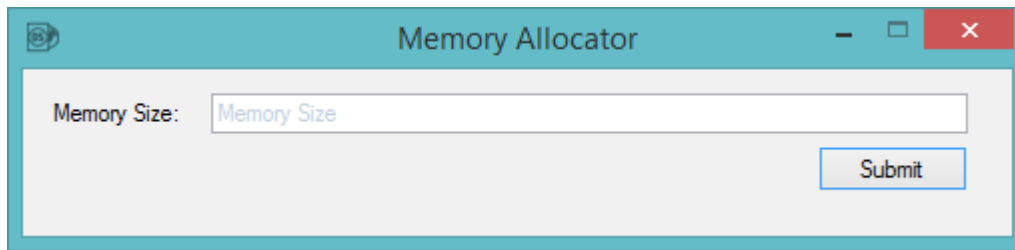

- And it will appear on the memory graph.

- You can also compact the memory to move all holes in the back.

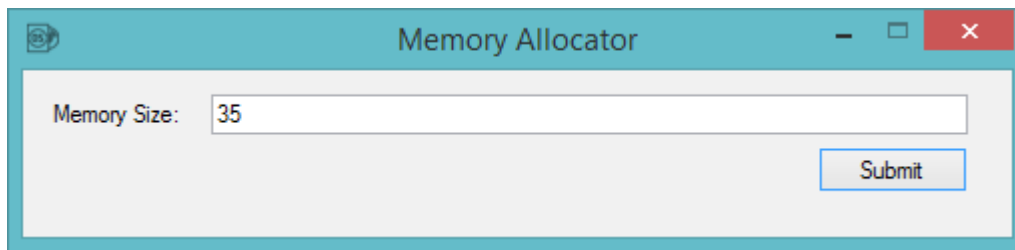

- When you finish testing you can click on [Reset](#) to start a new session.

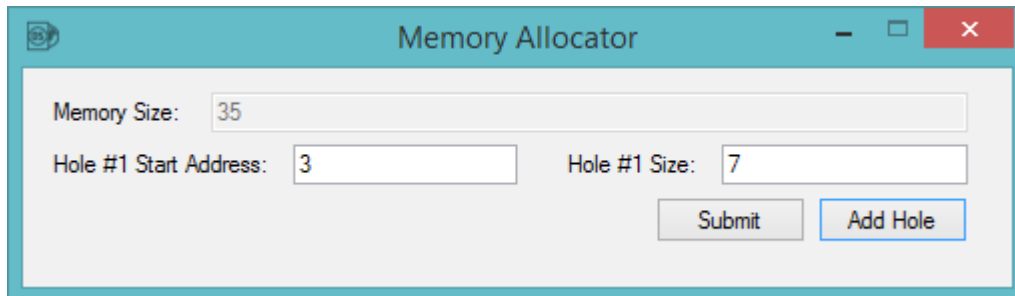

The screenshot shows a web browser window titled "Memory Allocator". Inside the window, there is a label "Memory Size:" followed by a text input field containing the placeholder text "Memory Size". To the right of the input field is a "Submit" button. The window has a teal header bar with standard window controls (minimize, maximize, close) on the right side.
